

EXPT NO:6c	DATA VISUALIZATION USING POWER BI

Aim:

To clean, preprocess, and transform the raw hotel booking dataset, load the clean data model into Power BI, and build an interactive visual dashboard to analyze booking trends, cancellation patterns, guest demographics, and pricing metrics.

Algorithm:

1. Import Dataset: Load hotel_bookings.csv into your environment.
2. Deduplication: Identify and delete duplicate rows across all fields
3. Drop High-Missing Columns: Remove the company column due to excessive missing/null data.
4. Impute Missing Values:
Replace missing values in agent with 0 (or median). Replace missing values in country with "PRT" (mode). Replace missing values in children with 0.
5. Handle Data Type & Syntax Errors:

Replace text anomalies (like "NA" strings) in numeric columns (children, adr) with 0 to prevent load errors.

Format reservation_status_date as Date, children / agent as Whole Number, and adr as Decimal.

6. Load Clean Data: Load the cleaned table into Power BI Desktop via Get Data > Text/CSV (or click Apply & Close from Power Query Editor).
7. Create Core Metric:
Right-click the table name → Select New Measure.
Define measure: Total Bookings = COUNTROWS(hotel_bookings)

Output:

RESULT:

Thus, the hotel booking dataset was successfully cleaned, preprocessed, transformed, and loaded into Power BI, and an interactive visual dashboard was created to analyze booking trends, cancellation patterns, guest demographics, and pricing metrics effectively.
